RESULT T17401

Library transcription regulator WBSCR9 - mouse
N.Alternate names: Williams-Beuren syndrome deletion transcript 9 homolog
C,Species: Mus musculus (house mouse)
C,Species: Mus musculus (house mouse)
C,Species: Mus musculus (house mouse)
C,Species: Mus musculus (house mouse)
C,Species: Mus musculus (house mouse)
C,Accession: T1401
R,Peoples, R.J.; Cisco, M.J.; Kaplan, P.; Francke, U.
Cytogenet. Cell Genet. 82, 238-246, 1998
A,Fittle: Identification of the WBSCR9 gene, encoding a novel transcriptional regulator, i
A,Reference number: Z18735; MUID:99077764; PMID:9858827
A,Accession: T17401
A,Status: preliminary; translated from GB/EMBL/DDBJ

The invention relates to a method of determining the angiogenic index of a tissue or cell sample comprising assessing, in a sample, the expression levels of one or more differentially-expressed gene from any of 34 DNA sequences, given in the specification, where the levels are indicative of the angiogenic index. The methods and compositions of the present

The invention relates to 2495 novel polynuclectides (I) and their encoded polypeptides, sequences hybridizing to these nuclectides, sequences encoding partial polypeptides and sequences having 71% to 90% identity to the nuclectide and protein sequences. The nuclectides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120

This invention relates to a novel isolated polynucleotide comprising a nucleotide sequence selected from one of 1680 sequences, a mature protein coding portion of them, an active domain of them and thekir complementary sequences. The invention may be useful for the production of compounds with an antiarthritic, antiparkinsonian, neuroprotective, nootropic, antibacterial, antiviral, antipsoriatic, antipforiatic, antiinflammatory. In addition, the disclosed sequences may be useful for gene therapy. The polypeptides or their antibodies are useful for gene therapy. The polypeptides or their antibodies are useful for treating many diseases such as arthritis, Parkinson's, Alzheimer's, autoimmune diseases, cancer, psoriasis, inflammatory bowel disease and infections caused by bacteria, yourses, fungi or parasites. The present sequence is that of a human polyment of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 QGHATPALPFKETQELLLSPLPQEGPGSLAAGESSSLSASTSVSDSSQKKEEHNYSLFVS 184

New isolated polynucleotide, useful in research, diagnostic or therapeutic methods, e.g. preventing or treating disorders involving aberrant protein expression or biological activity.

Claim 20; SEQ ID NO 588; 394pp; English.

The present invention relates to novel human coding sequences (ABQ99268-CABQ9608) and proteins (ABP64682-ABP65022). The sequences are useful in therappertic diagnostic and research methods. The polymucleotides may be used in the field of molecular biology as hybridisation probes, primers for PCR, for chromosome and gene mapping, for the recombinant production of protein, or in generation of anti-sense DNA or RNA. The polymucleotides are useful in diagnostics as expressed sequence tags (ESTS) for identifying expressed genes or for physical mapping of the human genome. The proteins may be used as molecular weight markers, or as nuritional sources or supplements. The proteins may be used to maintain and expand cell population in a totipotential or pluripotential state and expand cell population in a totipotential or pluripotential state cuseful for re-engineering damaged or diseased tissues, transplantation, and expand cell population in a totipotential or pluripotential state useful for re-engineering damaged or diseased tissues, transplantation, computed to the proteins are useful for preventing, treating or ameliorating disorders involving aberrant protein expression or completed and proteins are useful for preventing, treating or anciple disorders involving aberrant protein expression or contral parterial or fungal infection, autoimmune disorders, non-healing or viral, bacterial or fungal infection, autoimmune disorders, non-healing viral, bacterial or fungal infection, autoimmune disorders, non-healing captuncleotide sequences of the invention were assembled from ESTS isolated mainly by sequences of the invention were assembled from ESTS captures obtained find not form part of the printed gasel. Note: The sequence of asset for this patent did not form part of the printed sequences obtained in electronic format directly from WIPO at the printed gasel.

The polypeptides and polymucleotides are useful for treating and disgnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, Sjogren's syndrome, vasculitis, arthritis, systemic haemolytic anaemia, autoimnune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the

burnary Saguences AAV58480-Y58532 represent immunogenic polypeptides derived from human herpes virus type 8 (HHV8, a gammaherpesvirus). HHV8 plays an important role in the pathogenesis of ADB-related Kaposi's sarcoma. The important role in the pathogenesis of ADB-related Kaposi's sarcoma. The invention relates to a novel method of detecting the presence of human herpesvirus 8 in a biological sample using peptides representative of cominant antigenic regions of HHV8. The method comprises contacting one or more isolated, immunogenic HHV8 peptides with an antibody-containing biological sample, and detecting the formation of a complex between the peptide and the antibody. The presence of a peptide-antibody complex indicates the presence of human herpesvirus 8. The detection of HHV8 infection and be used to diagnose AIDS-associated Kaposi's sarcoma. The HVV8-specific antibodies are useful therapeutically when for the passive immunisation of a human againet HHV8 infection, thereby reducing HHV8 related disease. The detection assays are highly specific, sensitive and accurate. Early detection assays are highly specific, sensitive and accurate. Early detection and treatment of Kaposi's sarcoma could diminish the severity of symptoms related to AIDS and the sensitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          124 SSPYQDEEVISKTPTLAQLNSEDSQSVSDSLYYPDSLFSVKQNPLPSSFPGKKITSRAAA 183

Previous assays for HHV8 antibodies such as immunofluorescence assays, immunoblots and enzyme immunosassays lack the sensitivity and accuracy needed for reliable diagnosis of Kaposi's sarcoma. Further advantages of the assays are that reproducible results are obtained and the method is suitable for rapid throughput and screening of samples economically. The invention provides a composition comprising nucleic acid, histone HI protein and expression vector operationally encoding a protein suitable for tethering the nucleic acid to the histone HI protein, where the retending protein is LANA. The composition is useful in aiding the retending protein is LANA in the host cell. The viral vector encodes a protein suitable for tethering DNA to Histone HI. Methods for screening correction suitable for tethering DNA to Histone HI. Methods for screening of viral proteins to histone HI and DNA binding sites are useful for viral proteins the method of viral transfer. The composition has applications to gene therapy, including the treatment of multiple sclerosis, services Huntington disease and diabetes. The present sequence represents the amino acid sequence of the Kaposi's sarcome as altigen (LANA), which acts as a tethering protein. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  184 PVCSSKTLQAEVPLSDCVQKASK-----PPSSTQIMVKTNMYHNEKVNFHVECKDYVKK 237

The present invention describes a system (A) for maintaining a plasmid as an episome in mammalian cells, comprising the rhadinoviral sequence LANA (latency-associated nuclear antigon) of 3489 base pairs (see ABA93487, S1) expressed in the cell, and the rhadinoviral sequence RVCAE (rhadinoviral cis-acting element) of 801 base pairs (see ABA93488, S2) present in the plasmid Also describes is a method for maintaining a closed circular DNA in a cell by expressing (S1) in the cells and having (S2) as a cis-acting and maintenance sequence in the DNA. (A) is particularly used in gene therapy (or other gene transfer applications) persistence of gene therapy wetcors in cells. The present sequence represents Kaposi's sarcoma-associated herpesvirus (KSHV, also called the present in the BNA protein, which is used in the exemplification of the present in the exemplification of the present in the mann herpesvirus (school in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the present in the exemplification of the present in the exemplification of the present in the exemplification of the present expression of the present exemplification of the pr

The invention relates to an assay for determining whether a compound modulates LANA (latency-associated nuclear antigen) from KSHV (Kaposi's arcoma-associated herpesvirus, also known as HHV8, human herpesvirus 8) mediated persistence in a mammalian cell of a DNA episome having RVCAE (rhadinovirus cis-acting element) by detecting whether the compound inhibite expression of a gene resident on that episome. Also included are maintaining a closed circular DNA in a mammalian cell in which LANA is expressed (by using RVCAE as the cis-acting origin and maintenance expressed) and maintaining a plasmid as an episome in a mammalian cell (comprising: (a) Expressing LANA in the cell; and (b) having RVCAE resident on the plasmid. Compounds identified as interfering with the interaction between LANA and RVCAE are useful in treating or preventing radiant or interaction (e.g. primary effusion lymphoma (PEL)). LANA acts in trans on a 0.8 KD KSHV R(terminal repeat) unit to mediate efficient episome persistence. The present sequence represents KSHV LANA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               209 GPSTLNPICQSPPVSPPRCDFANRSVYPPWATESPIYVGSSSDGDTPPRQPPTSPISIGS 268

                                                                                                                                                                                                                                                                             The invention relates to a composition comprising a latency-associated nuclear antigen (LANA) nucleic acid having any of 14 fully defined sequences of 10-61 bp given in the specification (ADV68159-ADV68172). The methods and compositions of the present invention are useful for detecting compounds that are agonistic or antagonistic for the binding of viral genetic material to genomic host DNA, in particular for detecting compounds for treating tumor and viral infections. This sequence corresponds to the LANA protein from the Kaposi's sarcoma-associated herpesvirus (also called human herpesvirus 8). The LANA protein tethers the viral DNA to the human chromosomal structural protein histone H1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    419

The invention discisles a composition compitation to more insuranced factor the invention discisles or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal composed on an animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polymucleotides or their antibodies. The polymucleotide or the compound that to pain and a pharmaceutical composition comprising the one or more of polymeptides or their antibodies. The polymucleotide or the compound that complements in a setting pain and spared nerve injury (SNI) in an animal (e.g. gene for the sequence data for this patent did not form part of the printed the sequence data for this patent did not form directly from WIPO at the specification) which is differentially expressed during pain. Note:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             189 KTLQAEVPLSDCVQKASKPPSSTQIMVKTNMYHNEKVNFHVECKDYVKKAKVKINPVQQS 248

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               442
polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating plan (e.g. spinal segmental nerve injury (thung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rat, pain, neuronal tissue, gene therapy, spinal segmental nerve injury, chronic constriction injury, CCI, spared nerve injury, SNI, Chung.

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence witch is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of the polynucleotide sequence which is differentially expressed in an enhant subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound of or identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more or more or more or more or more or more or more polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or the compound that preparent method for produce and that method for method for method for identifying a compound useful in treating pain and a pharmaceutical composition remaining a polypeptides or the compound that method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method for method f
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         modifices its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                               New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

The invention discloses a composition comprising two or more isolated rat cor human polynucleotides or a polynucleotide which represents a fragment, or human polynucleotides or a polynucleotide acid sequence. Also claimed are a vector comprising the movel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence of that is differentially regulated in an animal subjected to pain and a gent to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a compound comprising the compound that regulates the activity of one or more of the regulates the activity in an animal of one or more of the cativity in an animal of one or more of the cativity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating cativity in an animal of one or more of the polypeptides given in the polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic compensation or mene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 44, Application US/10164595
Patent No. 6657054
Patent No. 6657054
GENERAL INFORMATION:
APPLICANT: OriGene Technologies, Inc
TITLE OF INVENTION: Regulated Anglogenesis Genes and Polypeptides
TILE REFERENCE: 1U 103 H
CURRENT APPLICATION NUMBER: US/10/164,595
CURRENT FILING DATE: 2002-06-10
NUMBER OF SEQ ID NOS: 80
SOFTWARE: PatentIn version 3.1
SEQ ID NO 44
LENGTH: 639
